

This is a sample diagram of Walmart's Human Resources database. While this is a good structure showing the relationships between employees and how they are categorized, this database structure is limited. Because of the volume of employees Walmart has, the database might be slow to update new employees, employees that have separated with the company, or any change in status for a particular employee. Having a big data solution can update employee records in real-time. One can look at the employees currently employed with the company and look at his or her status at any given time.
